

Air Distribution Systems

MSD and MSDC **Swirl diffusers**

Application

The multi swirl diffuser MSD and MSDC are used in ventilation and air conditioning applications in industrial areas. Each diffuser is capable of introducing high supply air volumes to the space with the additional benefit that they can be used for installation heights as low as 2.5 m. The MSD and MSDC may be installed for the follow-

- Laboratories
- · Production rooms in the pharmaceutical industry
- Special clean rooms

The MSD and MSDC demonstrate the following characteristics:

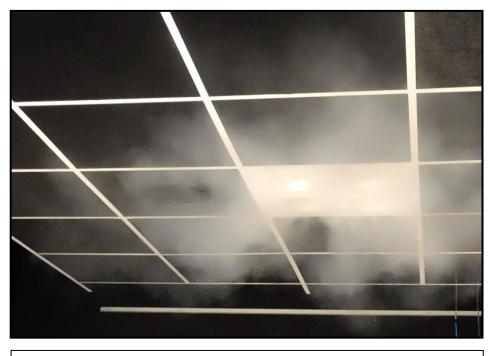

- The realisation of high cooling loads due to their high induction capacity
- · Draught-free room conditions due to extremely low vertical penetration depth

The requirements of EN 13779 are fulfilled with maximum temperature differences of 10 K in cooling mode and 6 K in heating mode.

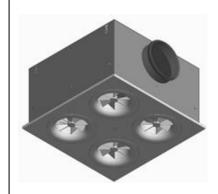

Function

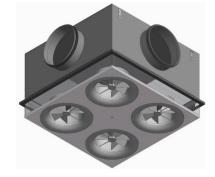

The standard versions of the MSD and MSDC, supply air into the room through 4 types SD or SDC swirl diffusers arranged to form highly inductive individual jets. Selecting the type SDC swirl diffuser with curved swirl blades further reduces both the sound power level and pressure loss of the diffuser. Sections of each swirl diffuser are deactivated to avoid an excessively high vertical penetration depth in the centre of the supply air diffuser assembly.

If a larger supply air volume flow is required, the plenum box may be equipped with an additional displacement section AKQ which allows the diffuser to deliver up to double the supply air volume flow.

Design/Options

Swirl diffuser options

The faceplate can be fitted with either type SD swirl diffusers flat blades, or type SDC, with curved blades. The type SCD differs offers a lower pressure drop and a lower sound power level for certain sizes. The recommended product options and sizes are shown in the table below.

Design and product options

The MSD is supplied as an assembly with a plenum box and a screw-on faceplate.

The square faceplate contains four swirl diffusers of sizes DN 125, 160 or 180. Two of the swirl diffusers have a clockwise swirl direction clockwise and the other two anticlockwise. Two swirl blades are deactivated on each swirl diffuser to prevent excessive vertical penetration at the centre of the swirl diffuser. This design allows high airflow per diffuser at low ceiling heights

Type SD swirl diffuser with flat blades

Type SDC swirl diffuser with curved blades

Section of different sizes and models by air volume

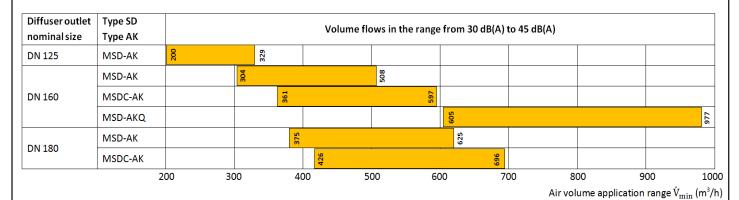

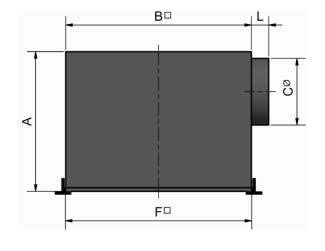

Figure 2: Recommended air volume application ranges for multi swirl diffusers type MSD and MSDC with plenum box type AK or AKQ

Plenum box options

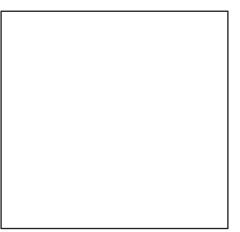

The plenum boxes are supplied as with and without displacement area options. The additional displacement section is visible below the ceiling and serves to increase the air output. It enables the volume flow rate to be doubled in order to achieve extremely high air change rates.

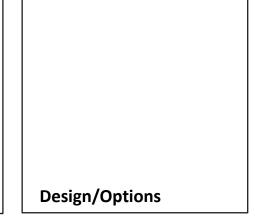

Installation type A: Supply air diffuser without displacement section

Installation type A1: Supply air diffuser mounted into ceiling grid

Centre distances between 2 diffusers and maximum air change rates

Supply air diffuser type MSD-AK

The minimum center distances between two MSD multi swirl supply air diffusers are 40 % (max.) less than between two single SD diffusers. This means, that the maximum air change rate can be increase to 30 ach 1/h using MSD diffusers compared to 12 ach 1/h using SD diffusers, whilst still providing the same air velocity distribution in the occupied zone.

The following formula is used to determine the minimum center distance:

$$t_{min} = \sqrt{\frac{\dot{v}}{n \cdot H}} \times 0.6$$
 with

 \dot{V} = Volume flow per diffuser in m³/h

n = Maximum air change rate for standard swirl diffuser type SD in ach 1/h

H = Discharge height of the supply air diffuser in m

Supply air diffuser type MSD-AKQ

The additional displacement area allows the volume flow per diffuser to be increased by a further 80 %. The minimum center distance between two supply air diffusers is reduced 35 % to a single swirl diffuser in the same application. Consequently the maximum air change rate increases to 50 ach 1/h.

The following formula is used to determine the minimum center distance:

$$t_{min} = \sqrt{\frac{\dot{v}}{n \cdot H}} \times 0.5$$
 with:

 \dot{V} = Volume flow per diffuser in m³/h

n = Maximum air change rate for standard swirl diffuser type SD in ach 1/h

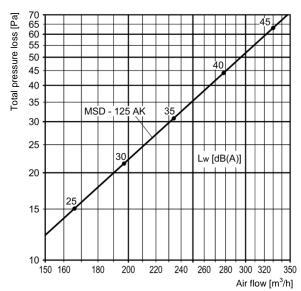

H = Discharge height of the supply air diffuser in m

Comparison of flow patterns when using swirl diffusers of either type SD or SDC

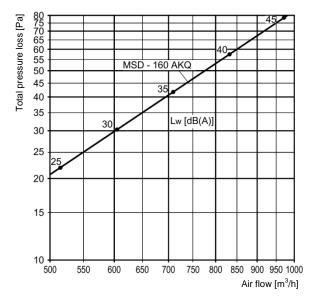

The swirl diffuser type SDC has a lower sound power output and a lower pressure drop then the type SD. However the vertical penetration depth of the SDC is smaller and the horizontal throw slightly greater. This means, that the maximum air volumes are reduced by approx. 8 % when the SDC is used in place of the SD.

Position	Description	No. of units	Unit price	Extended price
	MSD Multi-swirl diffuser for use as a supply air diffuser for creating an even air movement in a room using highly inductive individual jets to create the lowest temperature gradient. The swirl diffuser shall consist of a flat square diffuser plate with four integrated swirl diffusers type SD or SDC, of which two have a clockwise swirl direction and 2 have anticlockwise swirl direction. Each swirl diffuser has 2 swirl blades deactivated.			
	The assembly shall have a plenum box made of galvanised sheet steel. The diffuser faceplate shall be attached to the cross member in the plenum box by means of an M6 central screw.			
	Swirl diffuser Nominal size:			
	□ DN 125			
	□ DN 160			
	□ DN 180			
	Swirl diffuser model:			
	□SD			
	□ SDC			
	Swirl diffuser finish: Powder coated RAL			
	Plenum box construction:			
	□ Without displacement section			
	□ With displacement section			
	MSD Plenum inlet duct connection:			
	□ 1 spigot DN			
	□ 2 spigots DN(90°/ 180° offset)			
	Mounting type:			
	□ Diffuser and plenum to suit modular grid size 600 / 625 mm			
	□ Plenum in grid, swirl diffuser below grid			
	□ Installation in smooth ceiling			
	Surface finish of plenum box:			
	□ Galvanised sheet steel			
	□ Painted according to RAL			
	Volume flow:			
	Max. sound power level:dB(A)			
	Max. pressure loss Pressure loss:Pa			
	Manufacturer: Strulik			
	Type: Multi swirl diffuser type MSD/MSDC
